Research Focus

My research focuses on using geophysical and geochemical methods to understand ocean worlds: how oceans couple to the thermal evolution and composition, and what this might mean for life. My experimental research involves collecting thermodynamic equations of state for fluids and ices. I have applied these equations of state to evaluating oceanic heat transport and double diffusive convection in Europa, and to the geophysical constraints imposed by ocean composition on the radial structures of Europa, Ganymede, Callisto, Enceladus, and Titan. I am also interested in the global geochemical fluxes in ocean worlds, by analogy to biogeochemical fluxes in the Earth system.
